

Mane Ghazaryan

Senior Unity Software Engineer | Mobile Games, LiveOps, Performance & Scalable Systems | 8+ Years

Summary:

Senior Unity engineer with 8+ years in high-scale mobile games, specializing in LiveOps, performance optimization, and custom Unity tooling. I take ownership of features from idea to post-release and build tools that make the whole team faster. Background in physics and applied mathematics.

Yerevan, Armenia

(+374) (55) 68-64-62

- Armenian (Native)

EXPERIENCE

Concept Studio | Senior Unity Developer

2023 – Present | [NG Slots](#), a large-scale mobile casino game with continuous LiveOps updates

Unity Development, LiveOps & Technical Ownership

- Led a data-driven optimization initiative: reduced lobby popup P95 frame time by ~15% and shrank the TMP fallback font atlas from 880 to 214 glyphs.
- Built a Unity Profiler CSV exporter (frame-time statistics, P95, worst-frame analysis) and TextMeshPro optimization and localization tooling (glyph usage analysis, asset cleanup).
- Built an Editor build configuration tool (dev/release) that applies all required settings automatically, replacing a manual Jira pre-build checklist; proposed CI/CD approaches (including Unity Cloud Build) for the team's build pipeline.
- Split a monolithic game container prefab into per-game prefabs and Asset Bundles, enabling on-demand loading and lower runtime memory.
- Built separate Unity packages and Git submodules for the minigames inside the main game, so each minigame can be developed, versioned, and maintained independently.
- Drove a technical improvements backlog, prioritizing with management and the CTO and assigning tasks based on team capacity.
- Developed and supported LiveOps features, backend-driven systems, and production releases; investigated crashes, ANRs, and performance regressions.
- Created reusable Unity packages for custom rewarded ads and runtime memory monitoring.
- Led code reviews, mentored developers, and contributed to architectural planning using SOLID principles and design patterns.

Skills

Unity & Mobile Development

- C# · iOS & Android
- Data structures & performance-oriented algorithms
- Mobile build pipeline (IPA / APK / AAB), signing & releases
- Client-server architecture
- Async/await & multithreaded workflows
- Asset Bundles & Addressables
- Unity Editor Tooling
- TextMeshPro

LiveOps & Production

- LiveOps & post-launch support
- Crash & ANR investigation
- Remote config & A/B testing
- Monetization (Ads, IAP, Subscriptions)

Performance & Stability

- Unity Profiler (CPU / GPU / Memory)
- Deep Profiler
- Frame Debugger
- Memory Profiler
- Performance & memory optimization (low-end devices)

Frismos | Unity Developer

2018 – 2023 | Dog Town ([IOS](#), [Android](#)), Cat Town, [Fish Adventure Seasons](#), [Birdland Paradise](#) . Hide and Seek (Roblox)

Gameplay & Systems Development

- Proposed game design and user flow improvements; a full sprint was dedicated to implementing features I suggested.
- Built core gameplay systems: 3D character behavior (navigation, animation controllers, custom shaders), object interactions, VFX, and 2D/3D UI.
- Implemented backend components in PHP and MySQL, managing player data, feature flags, and progression.
- Developed multiplayer Roblox gameplay in Lua, including player state management and session synchronization.
- Integrated and managed ads, analytics, and A/B testing SDKs (Unity Ads, AdMob, Facebook, Firebase).

EDUCATION

National Polytechnic University of Armenia
Yerevan, Armenia

Master's Degree in Informatics and Applied Mathematics
2019 – 2021

Bachelor's Degree in Physics and Applied Mathematics
2015 – 2019

Additional Technical Projects

Chess (WPF and [Unity](#)): player vs. AI with configurable search depth

MPI (C++): Parallel Shell sort optimization running on a cluster

Freelance Unity development (alongside full-time roles): built several small mobile games, including a word scramble puzzle and a hyper-casual game, and developed AI driving behavior for a car simulation.

- Frame stability, load time & runtime efficiency

Backend & Data

- SQL / MySQL
- PHP-based backend services
- Backend feature integration & data flow design

SDKs & Services

- Firebase (Analytics, Remote Config, A/B Testing, Crashlytics, Messaging, Realtime DB, Firestore, Storage)
- AppLovin mediation, Unity Ads, AdMob
- Facebook SDK
- Unity Analytics, Unity CCD

Tools

- Git, Bitbucket, GitHub
- Jira, Trello, Confluence
- Sourcetree
- Bugsnag, Crashlytics, Smartlook
